

A LA CARTE MENU

HABITAT AT HOME

MONARCH

Provide flowering native nectar plants, shelter from the wind, and water puddler for monarchs throughout the year.

CATERPILLAR

Encourage butterflies to stay in your yard and raise their young by providing larval host plants for emerging caterpillars.

NATIVE BEE

Being solitary in nature, native solitary bees are the perfect addition to any garden. Plant native flowering plants and provide nesting opportunities for ground-nesting and tunnel-nesting bees.

MOTH

Provide nectar for moths by planting native species that bloom during the night. Moths, like bats, are nocturnal and are an important food source for insect eating bats.

BAT

Plant an abundance of native agave species to help support nectar feeding species such as the endangered Lesser long-nosed bat.

*In cooperation with
Bat Conservation International*

LIZARD

A bio-rich yard with limited or no pesticide use, rock piles to provide shelter for hibernation, and bare earth for lizards to burrow and lay eggs.

CAVITY-NESTER

Nestboxes for Lucy's Warbler, Western Screech-owl, Ash-throated Flycatcher, and others. Bee boxes for tunnel-nesting, native, solitary bees. Preserving dead trees that are safe to maintain, providing additional natural cavities.

DARK SKIES

Limit light pollution with downward pointing, covered lights, and motion-activated outdoor lighting.

*In cooperation with
Dark Skies International*

POISON-FREE

Eliminate the use of insecticides, herbicides, and rodenticides. Practice natural pest removal strategies.
